Jesora Antivirus

PRODUCT GUIDE

Calm, honest protection for every device you own.

Jesora Antivirus watches for viruses, ransomware, password stealers, phishing and scams on your Windows PC, Mac, Android phone and iPhone. It tells you plainly what it found, what it did, and what it can't do on each device.

- Windows, macOS, Android and iOS
- Light and dark themes
- Files checked on your own device
- Free protection, 7-day trial of everything
- No ads, no price jump at renewal

JESORA LABS

INSIDE THIS GUIDE

Everything Jesora does, and what it doesn't.

Every picture in this guide is a real screen. Jesora has a light and a dark theme on every device, and you can pick Automatic to follow your system.

Overview	What Jesora is, and the six things it does
Windows	The Protection page, real-time protection, scan on launch, the watchdog, pausing
Guards	Ransomware shield, Credential Guard, Attack Blocker, USB scan, remote access, camera and microphone
Scanning	Smart, full and custom scans; threats and quarantine
Internet and privacy	Web protection, link checker, Wi-Fi, firewall, Scam Shield, data leaks, Smart Home
Cleaning and speed on a PC	Junk cleaner with a deep scan, big and duplicate files, uninstaller, PC health, startup manager
Recovery	Deleted files, USB virus cleanup, drive repair, earlier versions
Android	Virus scan, Live protection, web protection, scam messages, speed, cleaning, recovery, alerts
iPhone and Mac	What each can do, and the limits Apple sets
Honest limits	What Jesora cannot do, platform by platform
Plans and privacy	Free, Premium and Family, and what leaves your device

Light Dark

The same Home screen on Android, in the light theme and the dark theme.

AT A GLANCE

Protection you can read, in plain words.

Jesora combines a scanner, always-on guards, safe-browsing tools and PC care in one app. Everything that gets you out of trouble is free, and the app never hides what it couldn't check.

Scans and real-time protection

Quick, full and custom scans, plus new files and each new program checked as it arrives or starts.

Guards against attacks

A ransomware shield with file rollback, Credential Guard for saved passwords, and Attack Blocker for dangerous commands.

Safe browsing

Dangerous sites blocked, links and Wi-Fi checked, passwords tested against known leaks without being sent anywhere.

Scam Shield

Paste a message about KYC, a parcel or a prize and Jesora tells you whether it is a scam, and why.

Cleaning and speed

A junk cleaner with a quick and a deep scan, startup manager, big-file finder and one-tap optimise.

Recovery

Look for deleted files, repair drives, and get photos and videos back from your phone's trash.

Honest by design. If a scan couldn't use a list of known malware, the app says "Scan incomplete" instead of "all clear". Where a platform doesn't allow something, such as scanning files on an iPhone, Jesora says so and doesn't pretend.

Always free, even after a trial or a lapsed plan

- Allow or remove a program a guard paused
- Threats, quarantine and restoring from it
- Restoring files after a ransomware attack
- Ending a remote-control session
- Switching off or removing the Jesora Firewall and its rules
- Protection itself: it never switches off on its own plan

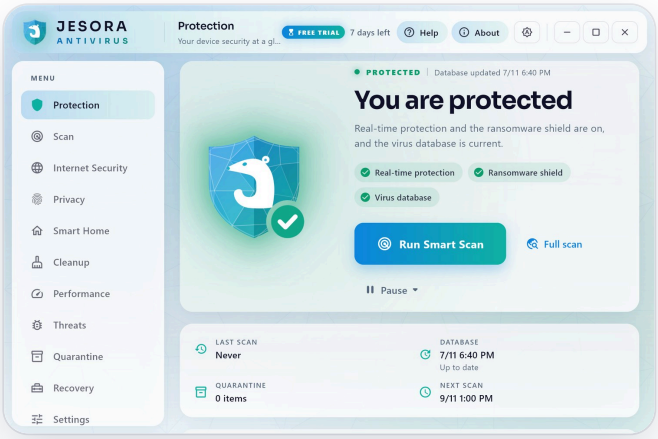

ON YOUR PC

One calm console, always on guard.

Jesora lives in the tray and starts with Windows. The Protection page shows one clear state: you are protected, or here is what needs attention. When protection is running, small attacks are shown bursting on the shield; when it isn't, nothing is shown.

Protection, dark theme

Protection, light theme

Real-time

New files in Downloads, Desktop, email attachments, files received in WhatsApp and the Startup folders are checked within a second of arriving.

Scan on launch

A program starting from a folder anyone can write to is paused, scanned, then let go, or stopped and quarantined if it is malware.

Watchdog

If something ends protection without you quitting it, a scheduled task starts it again within five minutes. Quit from the tray and it stays off.

Pause when you need to

Pause for 15 minutes, an hour, or until you resume. A pause is never forgotten: the page and the tray icon say so.

Quiet when it should be

Notifications and scheduled scans wait during games and on battery. A daily quick scan runs at 13:00 unless you change it.

Your choice of alerts

Show everything, only warnings and critical alerts, or only critical. Threats always show, and hidden alerts are still listed in the app.

ALWAYS-ON GUARDS

Stops what scanners alone can't see.

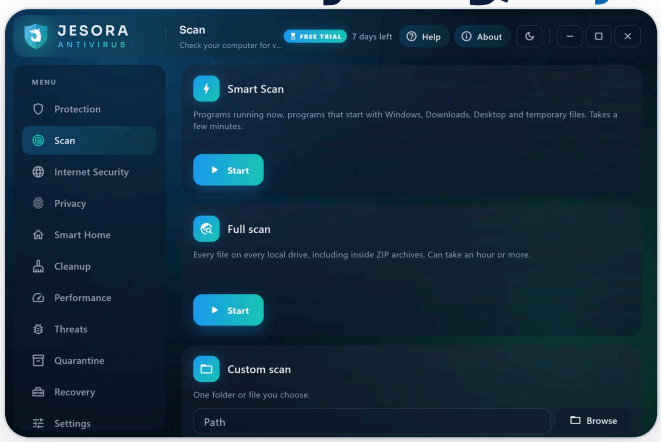

Malware hides from file scanners, but it still has to do something to hurt you. These guards watch for that. They are part of Premium and included for 7 days with every new install.

GUARD	WHAT IT WATCHES FOR	WHAT HAPPENS
Ransomware shield	Hidden decoy files and mass renaming in Documents, Pictures and Desktop	Names the program writing the most data and can stop it. Safe copies of protected files can be restored.
Credential Guard	A program reading saved browser passwords, cookies, Discord or Telegram sessions or wallet files	Pauses it and lists it under Threats. You choose Remove or Allow.
Attack Blocker	Deleting shadow copies, switching Defender off, fake-CAPTCHA "paste this" commands, Office starting a shell, PowerShell download-and-run	Critical: stopped at once. High: paused until you decide. Medium: you're told.
USB auto-scan	A drive plugged in	Scanned as soon as it appears.
Remote access alarm	AnyDesk, TeamViewer and similar tools running a session	Warns you, with a button to end the session. If a caller asked you to install it, it is a scam.
Camera and microphone	An app starting to use them	Tells you which app.
Startup watch	Anything that sets itself up to start with the computer	Reports it, scanned straight away. Remove moves the entry, never the program, to Quarantine.
Jesora Firewall	Your own allow and block rules, and connections to known botnet servers	Rules you can switch on and off, and a network monitor.

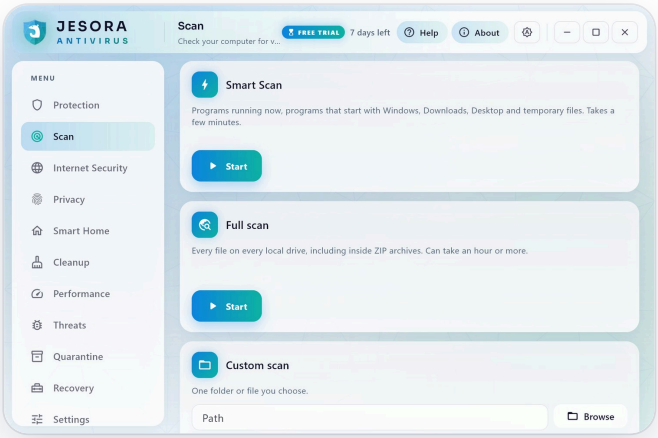

Be honest about timing. These guards check about twice a second. A program that finishes in under half a second can slip past Attack Blocker, and Jesora can't stop a program before it starts. It reports what it finds the moment it finds it.

SCAN AND DECIDE

Check everything, or just one file.

Scan, dark theme

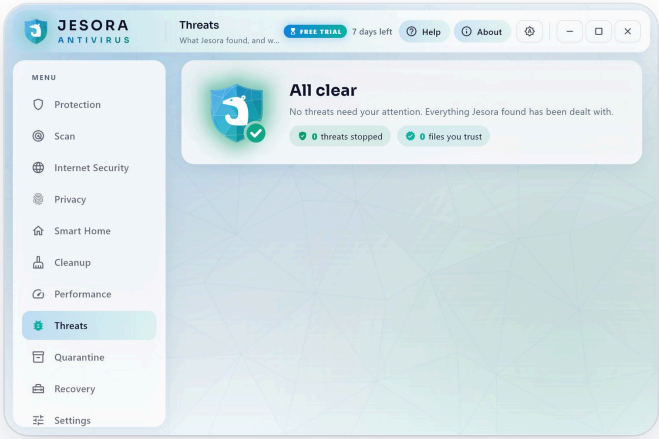

Scan, light theme

Three scans

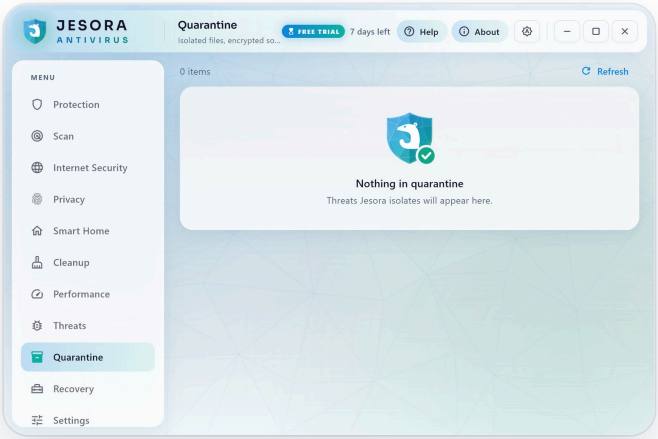

- **Smart Scan** looks where malware hides: running programs, startup entries, Downloads, Desktop and temporary files.
- **Full scan** checks every local file, including inside ZIP archives. It can take an hour or more.
- **Custom scan** checks one folder or file you choose.

How it decides

- Signatures, rules, behaviour checks and file-type tricks such as invoice.pdf.exe.
- Microsoft Defender gives a second opinion on programs and scripts.
- A valid code signature clears vague "suspicious" verdicts, so fewer false alarms.
- Threats go to an encrypted quarantine. A restored file is trusted from then on.
- Adware and hijackers are reported but never removed without asking.

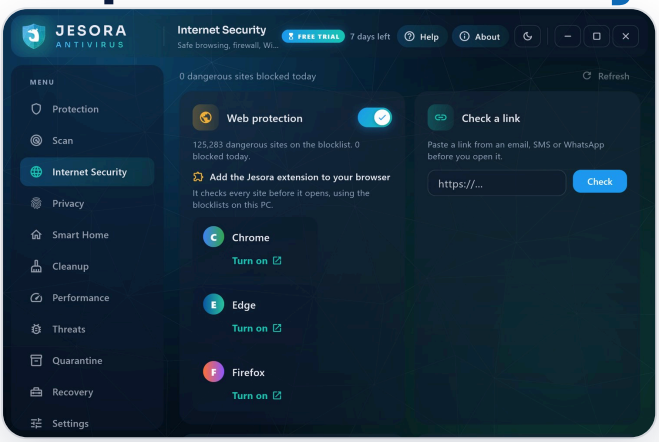

Threats waiting for a decision, or "All clear".

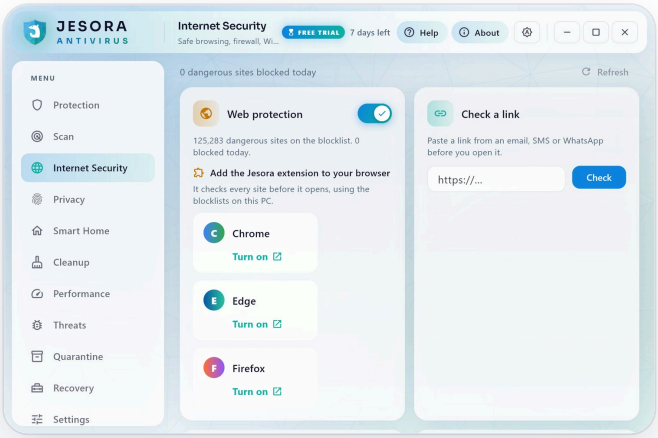

Quarantine: isolated, encrypted, and restorable.

BROWSE, MESSAGE AND CONNECT SAFELY

Stop the scam before you click.

Internet Security, dark theme

Internet Security, light theme

Internet Security

- Web protection blocks over 125,000 known dangerous sites and judges fake sign-in pages by their content.
- A browser extension for Chrome, Edge and Brave that also blocks trackers, and ads if you switch them on. Firefox is waiting for Mozilla's signing.
- Link checker, Wi-Fi inspector, and Windows Firewall status with a turn-on button.
- Password breach check: only five characters of a one-way fingerprint ever leave the PC.

Privacy

- **Scam Shield** reads a pasted message for KYC, electricity, parcel, prize, job, investment and "digital arrest" scams, and says why.
- Browser extension check, and a data leak monitor.
- File shredder for files that must not be recovered.

Smart Home

- Scans your home network on request: its devices, risky open services and how to fix them.
- Premium adds background monitoring and a warning when a new device joins.

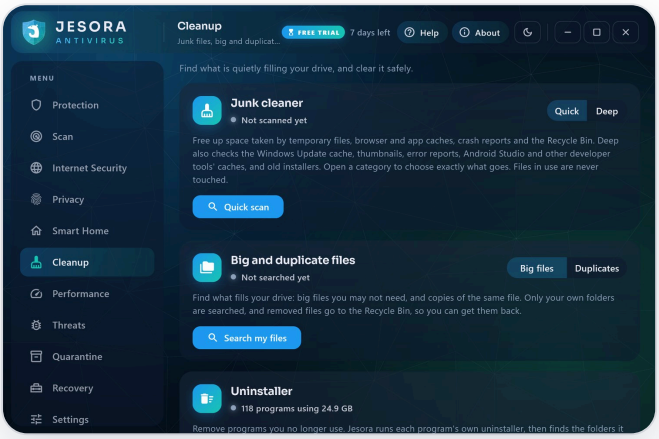

Security advisor

- Checks Windows updates, firewall, UAC, remote desktop, SMB1, auto-logon, guest account, file extensions and Secure Boot.
- A one-click Fix for each, and a weekly report of what Jesora found and what to do next.

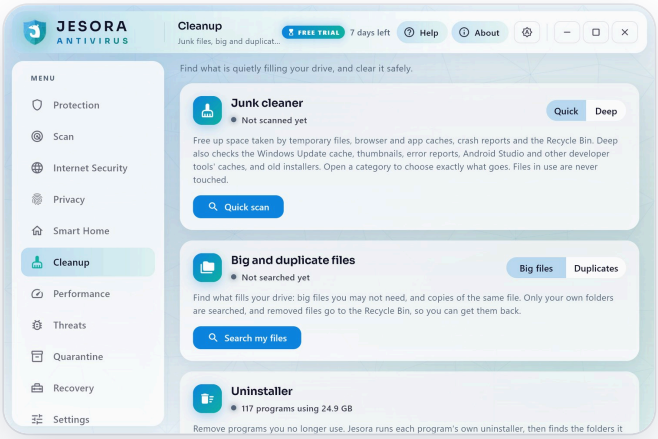

CLEANUP

Find what is quietly filling your drive.

The junk cleaner has two modes. Quick looks at temporary files, browser and app caches, crash reports and the Recycle Bin. Deep goes further, and it is free to run on every plan. Cleaning what only Deep finds is part of Premium.

Cleanup, dark theme

Cleanup, light theme

What a deep scan adds

- Windows Update leftovers, thumbnail and Delivery Optimization caches, and Windows.old.
- Developer caches: VS Code, Cursor and other editors, JetBrains, Android Studio, Gradle, Maven, npm, pnpm, pip, Yarn, NuGet, Composer, Deno, Go and Cargo.
- Docker's unused images, Jenkins workspaces, Conda downloads and test browsers.
- Old installers in Downloads and unfinished downloads.

Careful by default

- Nothing is cleaned while the app that uses it is open.
- Anything that costs a download to rebuild starts unticked.
- pnpm and Bun stores are sized by the space a clean really frees, since projects share their files.
- Your own files, such as installers, go to the Recycle Bin so you can get them back.

Big and duplicate files

Find large files you may not need and copies of the same file in your own folders. Removed files go to the Recycle Bin.

Uninstaller

Runs each program's own uninstaller, then finds the folders it left behind. Also lists bloatware and unwanted programs.

PERFORMANCE AND RECOVERY

A faster PC, and a way back for lost files.

PC health

- One score out of 100 with the reasons behind it, and a fix for each.
- Optimise now clears junk that is always safe to remove.
- Startup manager shows what starts with Windows and how long your PC takes to start, with a history.
- Weekly report of threats found, sites blocked, scans and what to fix.

Drives and power

- Drive optimisation: TRIM for SSDs, defragmenting for hard drives.
- Power plan: High performance, Balanced or Power saver, with a warning when power saver is on while plugged in.
- App updates, with the ones that carry security fixes marked.

Recovery

- Search for deleted files on FAT, exFAT and NTFS drives, plus a deep search that finds photos, videos, documents and zips by their contents.
- USB virus cleanup: shows the files and folders a shortcut virus hid, and quarantines the virus.
- Drive check and repair, including drives Windows calls unreadable.
- Earlier versions of a folder's files from Windows' snapshots.

Premium

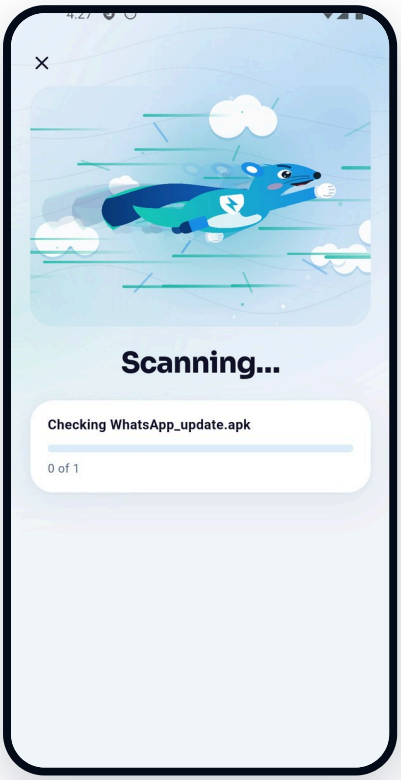

- Restoring deleted files and earlier versions, and file repair.
- Quick boost, weekly auto-clean, closing apps and turning startup apps off.
- On Free you can see what can be saved and what is slowing the PC.

No miracle claims. Jesora doesn't promise to "boost RAM". Quick boost frees memory held by idle apps for now, and the PC health score counts only things that really slow a PC: junk, startup apps, a nearly full drive, memory pressure, power saver, a long uptime, and apps with security fixes waiting.

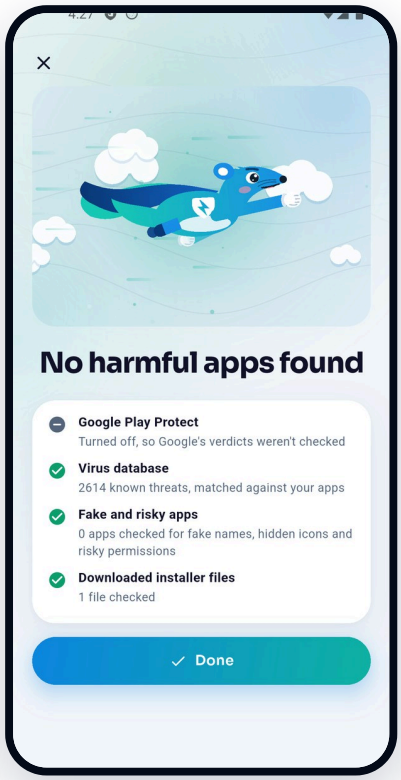

ANDROID

A virus scan built around what Android allows.

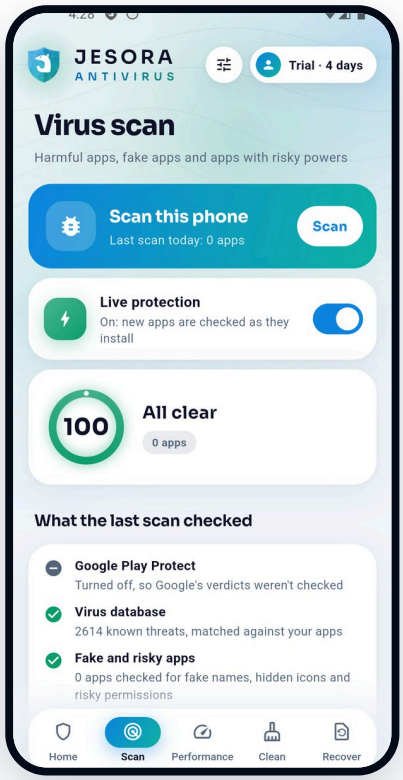

The Scan tab checks your apps for harmful and fake ones, and shows exactly what it was able to look at, so a clean result always means something. This is the light theme; the same screens are in the dark theme on the next page.

Scanning: the caped mongoose flies

A finished scan, and what it checked

The Scan tab

What it checks

- Google Play Protect's verdicts on every app.
- Jesora's signed virus database, matched against your apps and installer files.
- Fake apps: a "WhatsApp" that isn't the real one, or a "System Update".
- Apps hiding their icon, and risky mixes of permissions such as Accessibility with SMS access.

What you can do about it

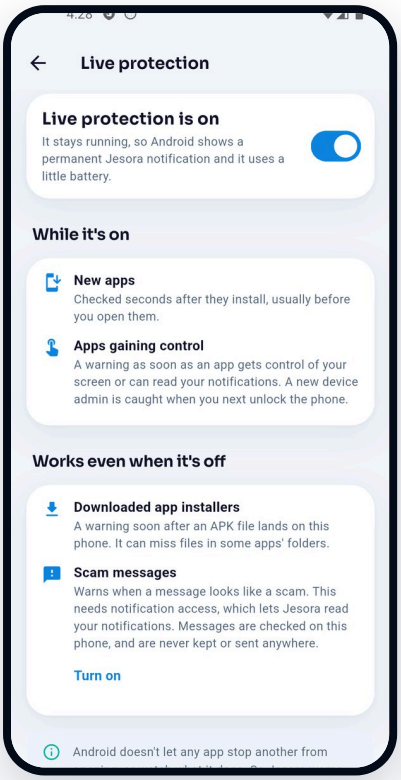

- Remove an app in one tap, or delete a harmful installer file.
- Turn on Play Protect from the app when it is off.
- Hide a finding you trust. It stays listed in your Protection report, and you can bring it back.
- A score from 0 to 100 and a plain headline: protected, scan incomplete, or "N things need you".

The phone's own list. Jesora's phone database currently holds about 2,600 known stalkerware and spy-app entries, and it updates itself every 12 hours. It is smaller than a desktop antivirus's database and grows as sources are added. Google Play Protect adds its own verdicts when it is on, and the app always shows which of these it could use.

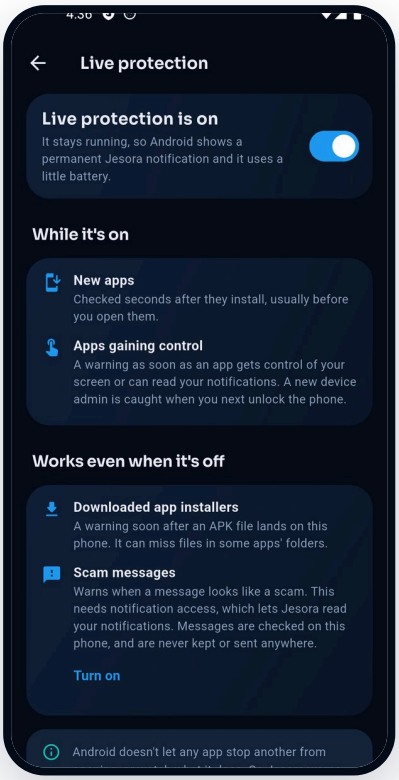

ANDROID

As close to live as Android allows.

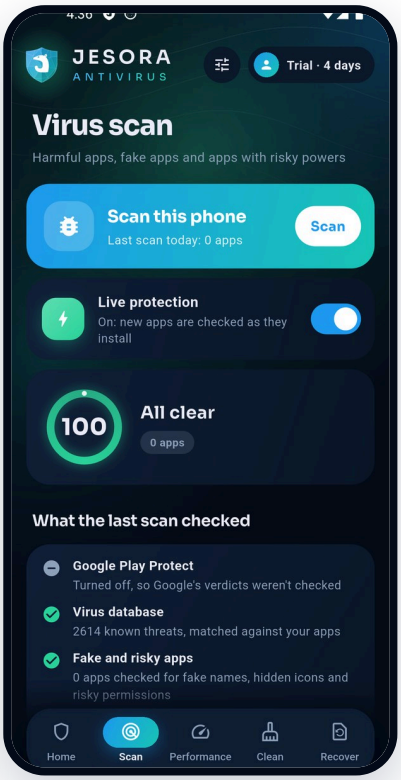

Live protection is optional and free. It keeps Jesora running, so Android shows a permanent notification and it uses a little battery. Turn it on from the Scan tab.

Live protection, light theme

Live protection, dark theme

Scan tab, dark theme

While it is on

- New apps are checked seconds after they install, usually before you open them.
- A warning as soon as an app gets control of your screen, or can read your notifications.
- A new device admin is caught when you next unlock the phone.
- Restarts after a reboot or an app update.

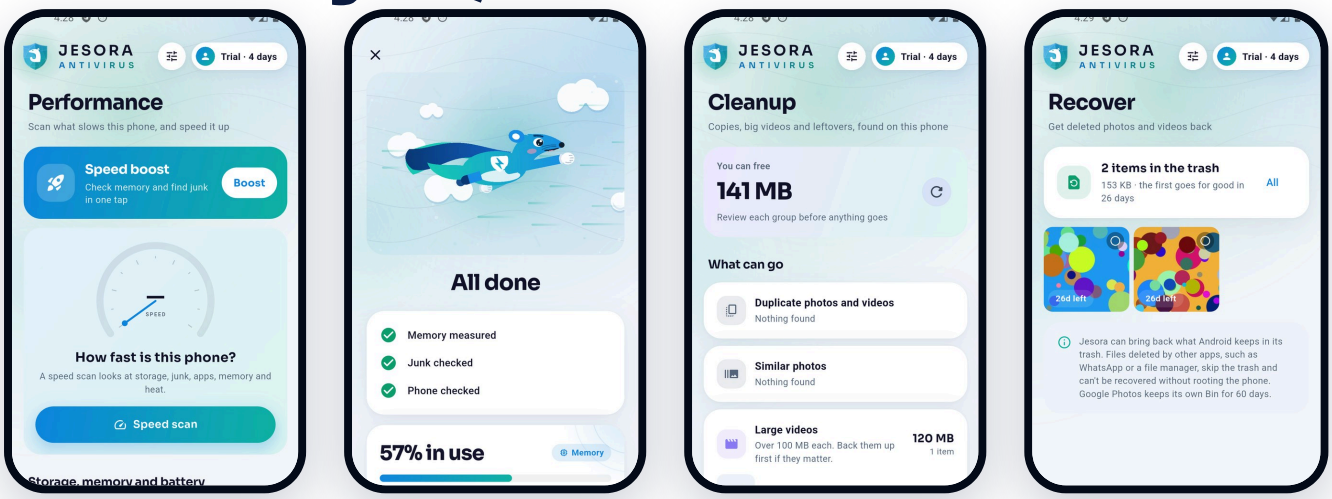

Works even when it is off

- A warning soon after an APK file lands on the phone (needs all files access).
- Scam messages: SMS, WhatsApp and other messaging apps are checked as they arrive. This needs notification access, which you can take away at any time. Messages are checked on the phone and never kept or sent.
- Regular checks every 1, 3, 6, 12 or 24 hours.

It warns, it can't block. Android doesn't let any app stop another from opening or watch what it does. So Jesora warns you right after something happens, and you remove the app. If warnings don't arrive on some phones, set Jesora's battery use to Unrestricted in Android's settings.

ANDROID

Faster and lighter, and honest about it.

Performance | Speed boost | Cleanup | Recover

Performance

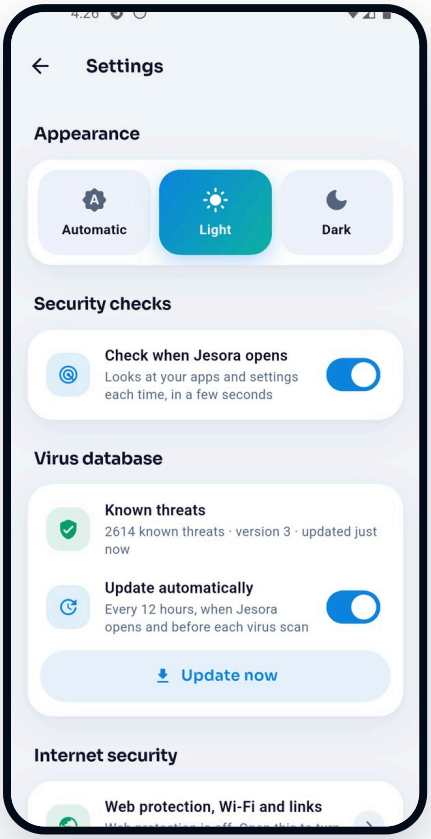

- A speed scan looks at storage, junk, apps, memory and heat, and walks you through the fixes.
- **Speed boost** closes idle background apps on Android 13 and older and shows the memory really freed. Android 14 and later don't let any app close others, so Jesora measures and finds junk instead, and says so.
- Every app you haven't opened in a month, and all apps by size, with Usage access. The lists update as soon as you remove one.
- Clear every app's cache in one tap on Android 11 and later, after Android's own confirmation.

Cleanup and Recover

- Duplicate and similar photos, large videos, old screenshots, leftover installers and junk folders, each confirmed before anything goes.
- Contacts saved more than once, to merge in the phone's own Contacts app.
- Photos and videos go to Android's trash for about 30 days, and Recover brings them back. Other files are deleted for good, after asking.
- Data use by app, with Premium.

ANDROID

You decide what Jesora tells you, and when.

Settings: look, security checks and the virus database

Alerts you can switch

- An app installed from outside an app store, or a harmful app found.
- Storage almost full, at 5, 10, 15 or 20 percent.
- A reminder after a week without a check.
- Which alerts show: everything, warnings and critical, or critical only.

Quiet when you want

- Do not disturb for an hour, until morning, or until you turn it off. Held alerts go out when it ends.

Undo anything

- Restore default settings, with an Undo.
- Light, dark or automatic theme.
- Update the virus database now, or let it update itself.

Web protection

A local VPN that reads only site names and refuses dangerous ones, in every app and browser. Your browsing never passes through Jesora. It warns you if Private DNS or another VPN gets around it.

Protection report

Lists the sites blocked, the sites you allowed, and what you hid, each with a way to undo it. There is no quarantine on a phone, because Android doesn't let one app lock away another.

APPLE DEVICES

The same promise, within Apple's rules.

iPhone

iOS keeps every app in its own space, and no app, from any company, may look inside another. So Jesora doesn't pretend to scan files on an iPhone. It checks what iOS does show, and guards you against scams and leaked passwords.

- Security check: screen lock, updates and signs of a jailbreak.
- Scam, link and password breach checks.
- Photo and video cleaner: duplicates, screenshots and large videos.
- Storage and battery check.
- Blocking dangerous sites in Safari is planned.

Subscriptions are bought in the App Store, at the price it shows.

Mac

The Mac app runs the same engine as Windows, with guards tuned to Mac threats. Mac versions are coming soon.

- File scanning and real-time protection.
- Ransomware shield and Credential Guard for browsers, wallets, Telegram and the keychain folder.
- Fake password prompt alerts and dangerous paste commands.
- Web protection with a browser extension.
- Junk cleaner with Xcode, simulator and developer caches.

Blocking a program before it opens needs Apple's Endpoint Security permission, which Jesora will apply for.

PLAIN FACTS

Every platform is different. We say how.

	WINDOWS AND MACOS	ANDROID	IPHONE
File scanning	Yes: signatures, rules and behaviour checks	Installed apps and downloaded installers	Not allowed by Apple: apps can't read other apps
Always-on guards	Real-time, scan on launch, ransomware shield, Credential Guard, Attack Blocker	Optional Live protection	None: iOS runs no checks in the background
Safe browsing	Browser extension	Local VPN filter for every app	Link checker (Safari blocking is planned)
Scams, links, passwords	Yes	Yes, including scam messages with your permission	Yes
Cleaning	Quick and deep junk cleaner, big and duplicate files	Duplicates, large videos, screenshots, installers	Duplicate photos, screenshots, large videos
Recovery	Deleted files, drive repair, earlier versions	Photos and videos from the trash	Points you to Recently Deleted

It warns, it doesn't pre-empt. Jesora detects a threat just after it appears or starts, because blocking a program before it runs needs special access that only Microsoft, Apple and Google give to a few partners. Jesora reports the moment it finds something and gives you a one-tap fix.

The phone's malware list is small, for now. It covers known stalkerware and spy apps, not every kind of Android malware. The phone scan also relies on Google Play Protect and Jesora's own fake-app, hidden-app and permission checks. The app always shows which of these it used.

Runs beside Microsoft Defender. Windows only lists a program as your antivirus once its maker has joined Microsoft's security programme, so Windows Security does not list Jesora yet. Keep Microsoft Defender turned on: the two work side by side, and Jesora asks Defender for a second opinion on programs and scripts while it is on. If Windows says it can't find an antivirus, Defender is off.

No claims we can't back. Jesora doesn't promise to find every threat, to speed up your PC by a percentage, or to boost RAM. It tells you what it checked and what it found.

FREE, PREMIUM AND FAMILY

Malware protection is free. The rest is fair.

Every new install gets every feature for 7 days, then stays on Free. Protection never stops altogether, and what gets you out of trouble is never paid.

	FREE	PREMIUM
Malware	All scans, real-time protection, scan on launch, watchdog, quarantine, database updates	Ransomware shield and rollback, Credential Guard, Attack Blocker, USB auto-scan
Internet	Web protection, link and Wi-Fi checks, password breach check	Jesora Firewall (own rules), network monitor
Privacy and home	Scam Shield, network scan on request	Remote access alarm, camera and mic alerts, data leak monitor, shredder, new-device alerts
PC care	Security advisor, PC health, junk cleaner including the deep scan, startup list, big-file finder	Cleaning what the deep scan finds, quick boost, weekly auto-clean, turning startup apps off
Recovery	USB cleanup, drive check, searching for deleted files	Restoring deleted files, earlier versions, file repair
Phone	Virus scan, Live protection, web protection, scam, link and password checks, speed scan, Speed boost, alerts	Clearing duplicate photos and large videos, old downloads and big files, restoring deleted photos and videos, data use by app

Free

₹0 forever. Windows, macOS, Android and iOS.

Premium

₹299 a year (about US$10.99) for 1 device.

Family

₹699 a year (about US$25.99) for up to 5 devices, in any mix. Share a spare seat by email.

Planned prices, which may change before launch. Subscriptions bought in Google Play or the App Store are managed and refunded there. Signing in is optional: it links your purchase to the website and your other devices.

Your files stay on your device. Scans run locally. Jesora sends only what a feature needs and says so on screen: five characters of a password fingerprint for the breach check, site names for web protection, and nothing at all for scam messages, which are read on the device and never kept.

Jesora Antivirus is made by Jesora Labs, the small studio behind Pennvo, !Locker, RackHatch, Event Reminder and Inkora. We build calm, honest software and sell it at one fair price.

Get started

1. Install Jesora on your Windows PC or Mac, or from Google Play or the App Store.
2. Let it run its first scan and database update.
3. Turn on the browser extension (PC) or web protection and Live protection (Android).
4. Open Settings to choose your theme and which alerts you want.
